In electronics, logic synthesis is a process by which an abstract specification of desired circuit behavior typically at register transfer level (RTL) is turned into a design implementation in terms of logic gates typically by a computer program called a synthesis tool. Common examples of this process include synthesis of designs specified in hardware description languages (HDLs) including VHDL. Von Neumann architecture was first published by John von Neumann in 1945. His computer architecture design consists of a control unit, arithmetic and logic unit, memory unit, registers, and inputs/outputs. Von Neumann architecture is based on the stored program computer concept where instruction data and program data are stored in the same memory.
