Logarithm Wikipedia
April 18th, 2019 - In mathematics, the logarithm is the inverse function to exponentiation. It is an example of a concave function. That means the logarithm of a given number x is the exponent to which another fixed number the base b must be raised to produce that number x. In the simplest case, the logarithm counts repeated multiplication of the same factor e.g., since $1000 = 10 \times 10 \times 10 = 10^3$, the logarithm of 1000 with base 10 is 3.

April 19th, 2019 - What is a logarithm? A logarithmic function is an inverse of the exponential function. In essence, if a raised to power y gives x then the logarithm of x with base a is equal to y. In the form of equations $a^n = x$ then $\log_a x = n$. This shows what power we need to raise a to or if x is greater than 1 how many times a needs to be
